Integrated Palliative Care of Respiratory Disease

Stephen J. Bourke 2019-07-22 The second edition of this book brings together the knowledge, skills and attitudes of specialists in both respiratory and palliative medicine to focus on the palliative care of patients with respiratory diseases. It deals not only with end of life care but also with symptom control and supportive care to improve the quality of life of those living their lives with advanced progressive lung disease. Integrated Palliative Care of Respiratory Disease builds on the previous edition introducing new models of care for patients with advanced lung disease. These models emphasize the introduction of palliative and supportive care at an earlier stage in the disease, and running disease-modifying and palliative treatments in parallel. There is a new chapter on the role of palliative care in lung transplantation'. The book highlights significant new research into key respiratory diseases and some on-going controversies about issues such as best models of care for different diseases and advance care planning. This book is an invaluable reference for doctors, trainees and clinical nurse specialists in respiratory and palliative medicine, and is of interest to anyone who wishes to gain a better understanding of the complex nature of palliative care in respiratory disease.

Lung Function Testing R. Gosselink 2005-04-01 Although diagnosis always begins with a careful history and physical examination and a physician is obligated to consider more than the diseased organ, testing of lung function has become standard practice to confirm the diagnosis, evaluate the severity of respiratory impairment, assess the therapy response and follow-up patients with various cardio-respiratory disorders. Ventilation, diffusion, blood flow and control of breathing are the major components of respiration and one or more of these functional components can be affected by any disorder. Frequently, no single pulmonary function test.

Mood and Cognition in Old Age Lia Fernandes 2018-11-30 Improving psychological well-being and cognitive health is now listed as the priority on the healthy aging agenda. Depression and cognitive impairment are great challenges for the elderly population. There have been numerous studies on depression and cognitive impairment and dementia. However, the neural correlates of depression and cognitive impairment have not yet been elucidated. With the development of neuroscience and relevant technologies, studies on anatomical and functional neural networks, neurobiological mechanisms of mood and cognition in old age will provide more insight into the potential diagnosis, prevention and intervention in depression and cognitive impairment. For example, longitudinal neuroimaging studies depicting the trajectories of patterns of structural and functional brain networks of mild cognitive impairment may provide potential imaging markers for the onset of dementia. Population-based studies have addressed the potential interaction between mood and cognitive impairment in old age. However, there are few studies to explore the potential neural mechanism of the relationship between depression and cognitive impairment in old age. In all of this process the contribution of multiple biological events cannot be neglected, particularly the underlying influence of chronic diseases and concomitant poly medication as well as the geriatric conditions, like frailty, frequently

present in this elderly population, which also compromise the cognitive function and mood determining depression and conducing to worse outcomes with more morbidity and mortality.
